SOV/79-30-3-48/69

yield, d_4^{20} 1.0819, n_D^{20} 1.4830. These data do not agree with those obtained by R. Dunbar and G. White (J. Org. Ch., 23, 915, 1958), who stated that they obtained N-acetylmethacrylamide which "decomposes at 300°". II (33%) is in the form of white crystals, mp 70°. I and II easily polymerize in the presence of initiators of the radical type to form soluble thermoplastics. Polymerization of I was conducted in the presence of benzoyl peroxide and dinitrile of azoisobutyric acid as initiators. The glass ampoules filled with the reaction mixture were sealed under 1 mm residual pressure, and were heated at different temperatures for different periods of time. Determination was made of the residual monomer in the polymer obtained. It was shown that 1.83, 1.09% of the monomer remains unchanged when benzoyl peroxide is used; and 3.75, 3.94% when the dinitrile of azoisobutyric acid is used. Block polymer of I is a transparent colorless glass; sp. gr. at 20° is 1.260. II readily polymerizes at its mp, without initiators. The polymer was separated in the form of white curd (67%). Thermomechanical properties

TITLE: Tensile testing of materials at high temperatures

SOURCE: Kauchuk i rezina, no. 9, 1965, 42-45

TOPIC TAGS: tensile test, rubber, test instrumentation, radiative heat transfer

ABSTRACT: The article describes a device for the tensile testing of rubber and other elastic materials with the aid of a reflecting radiant heater, and reports some results obtained with this device under equilibrium temperature conditions. The heater (see Fig. 1 of the Enclosure) permits a rapid heating of the samples to high temperatures and their exposure to a constant temperature for the desired period of time prior to the extension. A study of the kinetics of heating of a heat-resistant material to temperatures from 100 to 700C for preselected powers of the radiator showed that the equilibrium temperature was reached after 2 minutes. The dependence of the temperature of samples of various heat-resistant materials on the power of the radiator was also determined. On the basis of these experiments, a technique of tensile testing was elaborated, and it was found that

a comparison of the properties of materials at high temperatures is possible only by using results of tests performed immediately after the samples have reached a given temperature. Orig. art. has: 5 figures, 1 table, and 1 formula.

TITLE: Diffusion welding in carbon dioxide gas

SOURCE: Avtomaticheskaya svarka, no. 2, 1965, 23-27

TOPIC TAGS: diffusion welding, gas shielded diffusion welding, weld property, gas shielded welding

ABSTRACT: The feasibility of diffusion welding in a protective atmosphere of carbon dioxide instead of in a vacuum has been investigated. Since carbon dioxide does not promote any dissociation, sublimation, or reduction of oxide films on the metal surface, part surfaces have to be cleaned by a rotary brush inside the chamber. With this precaution, 30KhGSA¹ and MSt3¹ steels were successfully welded to U10A¹ tool steel, MSt3 steel to VK8¹ cemented carbide, St3 steel to SCh12-28¹ grey iron, and molybdenum to copper. The weld notch toughness depends upon welding temperature (see Fig. 1 of the Enclosure). Welds between steel and grey iron had a tensile strength of 13—15 kg/mm². The method has the same advantages as vacuum diffusion welding: it yields sound welds with high mechanical properties. Orig. art. has: 8 figures. [ND]

TITLE: Certain features of CO₂- and nitrogen-shielded diffusion welding 4

SOURCE: Svarochnoye proizvodstvo, no. 4, 1966, 13-15

TOPIC TAGS: acid Bessemer steel, diffusion welding, carbon dioxide, nitrogen, welding technology / St. 3 acid Bessemer steel

ABSTRACT: It is shown that diffusion welding can also be accomplished in the absence of a vacuum provided that the surface remains protected against oxidation. Thus, specimens of St. 3 acid Bessemer steel were welded in CO₂ and N₂ atmospheres following the prior mechanical cleaning of their surface in these gases (welding current 1030-1050°C, welding pressure 2.5 kg/mm²). The results proved highly successful compared with prior surface cleaning in normal air as in the latter case the thin oxide film forming within 15 min prior to the commencement of welding inhibits the diffusion of C in the contact zone and this prevents the formation of common grains in that zone. Thus, it is feasible to replace cumbersome and inefficient vacuum diffusion welding with CO₂- and N₂- shielded diffusion welding, on condition that

THE EFFECT OF A PREVIOUS ATTACK
OF A1 INFLUENZA ON SUSCEPTIBILITY
TO A2 VIRUS DURING THE 1957 OUTBREAK

A. N. SLEPUSHKIN

Influenza Department, Research Institute of Virology
USSR Academy of Medical Sciences, Moscow, USSR

55519908

The author reports on the effect of a previous attack of influenza caused by virus A1 on susceptibility to virus A2 in the light of analyses made of the rate of sickness from influenza and acute catarrhs of the respiratory tract in a half-bearing factory in the USSR in 1957. There were spring and summer trips to sickness and an autumn epidemic.

In the summer trip caused by A2 virus, the sickness rate for those who had been ill in the spring with A1 influenza was about half (4.7%) that for those who had not been affected in the spring (10.5%), but this was clearly an unstable and short-lived immunity as by the time of the autumn A2 epidemic, the rate for those sick in the spring rose to 21.6%, although this was still 4 times lower than that for those who had not been ill either in the spring or in the summer.

Vaccination with a polyvalent vaccine (A1 and B strains) was partially effective in the summer epidemic, but slight less so than seroprophylaxis with the same strains conducted in October. This also opens up the possibility of the same phenomenon of partial immunity derived from an old source of influenza virus of the same serological type as that causing an outbreak not long beforehand.

It is now clearly established that in people who have suffered from influenza an acquired immunity is built up which lasts from two to three years. At the same time the laws governing the natural variation of the influenza virus have been widely studied. Research has shown that changes in the antigenic structure of the virus occur under the influence of herd immunity (Gastros, Luyana, Zhilans). In fact, after an epidemic, the majority of the population becomes immune to the serological types of influenza virus which caused the infection. Its circulation in such a community forces the virus to adapt itself to these new conditions by changing its antigenic structure.

However, there is hardly any information available concerning the degree to which the susceptibility of people to a new variety or type of virus in the same evolutionary series (e.g., influenza virus A1) is affected by

TITLE: An investigation of automatic control systems and sources of supply for electric-spark cutting of metals with a disc electrode

PERIODICAL: Referativnyy zhurnal, Elektrotehnika i energetika, no.12, 1961, 41, abstract 12K 236. (In the Symposium "Problems of Electrical Machining of Materials", M., AS USSR, 1960, 188-214)

TEXT: A procedure is given for analysing automatic control systems for electric-spark cutting. Results of a study of the automatic control systems are used to develop a procedure for calculating controller parameters. A comparison is made between a number of supply circuits considered as components of automatic control systems. Practical recommendations are given concerning the selection of supply and controller circuits. ✓

"Criteria for Stable Operation of a Two-Phase Asynchronous Servomotor," by Ye. I. Slepushkin, Moscow, Avtomatika i Telemekhanika, No 11, Nov 56, pp 1020-1028

3 The conditions of stable operation for a two-phase servomotor as an element of automatic control and regulation were analyzed.

The criteria for the stability of an asynchronous servomotor in the general case of asymmetry when controlled by voltage variation and variation of phase angle displacement in systems without feedbacks were determined..

These criteria were expressed in terms of generalized parameters; the analytical results were confirmed by experimental data.

TITLE: Self-adjustment in Electro-erosion Cutting

PERIODICAL: Izvestiya Akademii nauk SSSR, Otdeleniye tekhnicheskikh nauk, Energetika i avtomatika, 1959, Nr 4, pp 138-147 (USSR)

ABSTRACT: Figure 1 illustrates the system; the various units (reading from left to right and top to bottom) are the main power supply (fed from the mains), a series (standard) resistor, a current amplifier, the cutting disc, a reduction gear, a motor, a power amplifier, the part being cut and a voltage amplifier; the amplifiers and motor are fed from a stabilized supply. The corresponding structural diagram is seen in Figure 2, where the top dotted unit represents the erosion gap and the dotted units at the bottom represent the self-adjusting circuits (left) and the main supply unit (right). Figure 3 shows how the cutting rate (vertical, cm/min) varies with the supply current I for various lengths of cutting line L and various supply voltages U (in V); δ is the thickness of the cutting disc. Figure 4 shows how the self-adjustment parameter K

Card 1/2 (in cm/sec-V) varies with the other parameters for specimens

Self-adjustment in Electro-erosion Cutting

SOV/24-59-4-17/33

of steel of sizes indicated in diagram a. Figure 5 shows similar results; so does Figure 6 but for circular rods 60 mm in diameter, where h is the depth of the cut into the rod, whose radius is r .

Section 4 deals with the stability of the controls but the analysis is in very general terms since the transfer coefficients of the various units in Figure 2 are highly variable quantities not expressible in analytic form. ✓

Some obvious general suggestions are made about ways of improving the performance of the control system.

There are 8 figures, 2 tables and 5 Soviet references.

TITLE:

Analysis of Governors Controlling the Welding Arc
Intensity in Connection with the Use of Direct-Current
Generators

PERIODICAL: Avtomaticheskaya sverka, 1952, Nr 7, pp 27-39 (USSR)

ABSTRACT: At the present time the method of continuous movement
of electrodes is widely applied in automatic welding.
However, in some cases it is necessary to have a go-
vernors that would automatically control the arc inten-
sity. This can be accomplished by using direct-action
governors (without an intermediate amplifier), which
are by no means inferior to the welding heads having
an independent speed of electrode movement. At the
same time, the use of direct action governors simpli-
fies the problem of the head drive construction and
enables the attaining of a continuous regulation of
speeds. The rotation speed of a direct-current gene-
rator can be governed by changing one or the other

Card 1/3

SOV/125-52-7-5/19

Analysis of Governors 'Controlling the Welding Arc Intensity in
Connection with the Use of Direct-Current Generators

of the following factors: voltage, resistance in the anchor circuit, and induction current. All these factors are applied in the designs of direct-action governors. The author submits 7 layouts for governors working from DC generators with independent induction and 4 layouts for those working from DC generators with successive induction. The calculations made by the author show that by using DC generators with successive induction, the intermediate processes of arc intensity regulation pass more quickly than in the case where a system of self-regulation is used. This shortening of time required for the process of arc intensity regulation furthers to a large degree the preservation of the arc burning stability. The direct-action governors controlling the welding arc intensity are simple in construction, reliable, and can be recommended for use in automatic welding machines with continuously regulated movement of the electrode wire.

SOV/125-59-10-6/16

AUTHOR: Slepushkin, Ye.I., Candidate of Technical Sciences
 TITLE: Direct-Action Arc Regulators with 2-Phase Motors
 PERIODICAL: Avtomaticheskaya svarka, 1959, Nr 10, pp 50-60 (USSR)
 ABSTRACT: The article contains details of regulators with 2-phase welding (AC) and gives possible variations of the regular lay-out in welding with 3-stage rectifiers; the static and dynamic properties are also given. A typical lay-out of a generator with a phase-shifting resistance in the feed-circuit is shown in Fig 1. Fig 1a illustrates that the winding of the motor governor (OUD) is of 2 voltages - arc voltage U_a and feed voltage U_z , while the exciting winding of the motor (OVD) is wired to another phase of the 3-phase circuit so that the angle between the voltages approaches 90° . To determine the quantities E_{OUD} , I_{OUD} , b and Z_d , the wiring scheme of the governor winding is presented as an equivalent scheme in Fig 1c, which is then developed to the lay-out given in Fig 1d. The estimated lay-out of the OUD winding in Fig. 1b gives the voltage of the feed source as $U_{OUD} = E_{OUD} = I_d - I_z \angle Refs$ 1 and 2, with the internal resistance Z_d . An alter-

Card 1/5

SOV/125-59-10-6/16

Direct-Action Arc Regulators with 2-Phase Motors

native method of phase displacement of the feed voltage is when the feed circuit consists of not R_p and X_L , but of R_c and X_c , in which case the feed circuit is served by the voltage on the condenser (Fig 1e). The regulated resistance R_p in a regulator at a given voltage in the lay-out X_L and X_c is respectively: $R_p = X_L \operatorname{ctg} \varphi_d$ and $R_p = X_c \operatorname{tg} \varphi_d$ (where $\varphi_d = \arccos \frac{I_d + \Delta I_o}{I_{x.x}}$, $I_{x.x}$ being the idle voltage of the welding

transformer and ΔI the fall in the voltage in the active resistance of the welding circuit). Every component of the insensitivity zone may be determined by means of the equation

$$l_{01.2} = I_{OVDK_p} \frac{S_d}{q_{vup} \sin(\delta_r \mp \varphi_{vup})},$$

which is explained at length in the text. The author then deals with regulators which have no phase-shifting resistance on the feed circuit, the main lay-out

Card 2/5

SOV/125-59-10-6/16

Direct-Action Arc Regulators with 2-Phase Motors

of which is illustrated in Fig 2a. The feed circuit is wired to the phase in the circuit which anticipates the voltage of the welding transformer by an angle of 120° (Figs 2a and 2b). The voltage in the OUD winding and the angle of phase difference between the voltages in the motor windings (Fig 2c) can be expressed thus:

$$I_{OUD} = \sqrt{K_N^2 I_D^2 + I_Z^2 - 2K_N I_D I_Z \cos(60^\circ - \varphi_D)} \quad \text{and}$$

$$\delta = \arctg \frac{0.865 I_Z - K_N I_D \cos(30^\circ - \varphi_D)}{0.5 I_Z + K_N I_D \sin(30^\circ - \varphi_D)}$$

where K_N is the coefficient of transformation of the composator AM. The results of calculations based on these formulae are given in detail and indicated in graph form in Fig 3, while Fig 4 shows the estimated resistance of a Type UM 50 watt experimental motor. Graphs of the initial power in the function I_D are given in Fig 5, and the minimum values of I_{IOD} when

Card 3/5

SOV/125-59-10-6/16

Direct-Action Arc Regulators with 2-Phase Motors

I_D and I_Z are given $\frac{I_{OUD\min}}{k_N} = I_D \sin (60^\circ - \varphi_D)$

and $\frac{I_Z}{k_N} = I_D \operatorname{tg}(60^\circ - \varphi_D)$. Fig 6 contains a diagram of

a twin-action arc regulator, fed from a 3-stage rectifier, but the basic system is much the same as in those mentioned above. Tests conducted on a direct-action arc-voltage regulator, the results of which are given in Fig 7, show that this type of regulator provides for a stable welding process and non-relay electrode ignition. The use of Type DAD2-350/50 350 watt 2-phase hollow-rotor servomotors is recommended. There are 3 diagrams, 3 graphs, 1 photograph, and 8 Soviet references.

AUTHORS: Moyzhes, A.S., and Slepushkin, Ye.I.

TITLE: Machine-rectifier generators for spark machining of metals

SOURCE: Problemy elektricheskoy obrabotki materialov. Tsentr. nauchnoissl. labor. elek. obrab. mat. AN SSSR. Ed. by B.R. Lazarenko. Moscow, Izd-vo AN SSSR, 1962. 115-128.

TEXT: There is a need for simple reliable and economic generators for spark machining, as existing supply sources are uneconomic, particularly because they use large ballast resistances. Impulses in the duration range of 10^{-5} - 10^{-3} seconds and energies of 10^{-2} - 10 joule can be generated by simple commutatorless machines based on frequency changers in current production. TsNIL-ELEKTROM, in developing a range of such generators, follows three main trends: 1) machine-impulse generators МИГ (MIG) with asymmetrical e.m.f. waveshape based on inductor synchronous alternators; 2) machine generators of impulses МГВ (MGI) with unipolar e.m.f. impulses based on d.c.

Card 1/4

Machine-rectifier generators for ... S/856/62/000/000/004/011
E194/E135

machines; and 3) machine-rectifier generators МВР (MVG) with unipolar e.m.f. impulses produced by half-wave rectification and based on frequency changers in current production. The last of these types was developed first because it is efficient (about 70%), flexible, simpler and makes better use of active material than do the other two types. In spark machining it is required first to strike the arc (high voltage, low current) and then to maintain it (low voltage, high current). It is because most machines are designed to have a naturally drooping characteristic or else are provided with ballast that they are so inefficient. This difficulty too can be overcome by the use of rectifiers. For this application, germanium and silicon rectifiers are preferred to selenium. In discussing design procedure, particular attention is paid to the voltage between the electrodes during the current impulse, which is considered as a back e.m.f. Of standard production machines, particularly type MVG-1 (based on welding frequency changer type ПС-100-1 (PS-100-1)) which has already been developed, is recommended for use as a machine-rectifier generator. In this set the frequency changer is driven by a

Card 2/4

Machine-rectifier generators for ... S/856/62/000/000/004/011
E194/E135

4-kW induction motor at 490 c/s. The exciter is supplied by a selenium rectifier. The armature consists of two parts on two separate bundles of stator stampings; these would give too high a voltage if connected in series and so they are either used separately or connected in parallel, each section giving an output of 65 V. This voltage is stepped up by a small transformer connected to one of the armature windings; it supplies the electrode gaps through a rectifier. Field regulation may still reduce the output voltage below that required for breakdown and so the ratio of the step-up transformer is made adjustable. To achieve the maximum current of one armature section of about 80 A, the generator and rectifier are fan cooled. The rectifiers used are silicon diodes, one in each section of the armature circuit. The maximum power dissipated in the arc gap when both armature sections work simultaneously is about 2.8 kW. The maximum output in making holes in heat-resistant steel was 1500 mm³/min. This generator type MVG-1, as compared with generator type MGI-2, of the same cost, gives about double the effective power, has a much higher efficiency, has a motor of less than half the output and

Card 3/4

Machine-rectifier generators for ...

S/856/62/000/000/004/011
E194/E135

weighs less than half. The output of the generator can be raised a further 25-30% by supplying two working positions and using both half-waves of e.m.f. Three other sets similar in principle which are being developed on the basis of other machines are briefly described. Thus type MVG-2 (based on standard machine type AJA-7M-0-8 (ALA-7M-0-8) will have an output of 3 kW at 430 c/s with a mean current of 200 A. This machine is now under study. Machine type MVG-3, now under development, should machine hard alloys to class 4 finish at 750 mm³/min, or to class 7 finish at a rate of 30 mm³/min, or heat-resistant steels at speeds up to 2500 mm³/min at a finish of class 3. These outputs will be obtained with mean current values of 25-250 A. Machine MVG-4 (based on a high-frequency generator of 8 kc/s) should deliver at an output of 16 kW at a mean current of 900 A. There are 10 figures and 1 table.

ABSTRACT: Earlier work on this effect in protecting mice against lethal radiation is cited. The present work aimed at establishing the relation between the activity of nontoxic doses of these inhibitors and survival of the animals, expressed as antiradical activity A, as product of its relative effectiveness &

(chemical) and concentration c : $A = \epsilon C$. The tests were conducted on 1526 mice irradiated with lethal doses, treated with one of 9 preparations injected intra-abdominally 15-45 minutes before irradiation. Their structural formulas, value ϵ and survival rate of the mice so treated are tabulated. These chemicals have in common the ability to accept free radicals. The antiradical activity is graphed and presents a simple linear function (up to 60% survival). A depends either on ϵ or on the toxicity of the agent, so that the concentration of the latter can be increased. The ratio of optimal radiobiological dose to maximal tolerance varies considerably; it is 1 for some, often considerably lower. For 2, 4-di-tert-butyloxytoluene the optimal dose was 50 mg/kg while 100 mg/kg results in zero survival; the maximal tolerated dose is 400 mg/kg [sic]. For 3-oxy-2,4-di-trimethylpyridine (64% survival rate) the optimum is 200 mg/kg, maximum tolerated 250 mg/kg. Thus, not only relative effectiveness and maximal tolerated dose, but also a value characterizing the reactive ability and toxicity of the accumulated radicals from the inhibitor ($R' + HIn \rightarrow RH = In$)

have to be considered in such experiments. It is concluded that the inhibitors tested are promising radiation-protective substances. "The authors wish to thank I. S. Belostotska, A. A. Volod'kin, K. TITLE: Relationship between the radiation protective and antitumoral
action of inhibitor-antioxidants

SOURCE: AN SSSR. Doklady, v. 164, no. 4, 1965, 934-936

TOPIC TAGS: radiobiology, radiation protection, radiation sickness,
radiation biologic effect, carcinoma, alkylphenol, phenol, amine,
organic nitrogen compound, mouse

ABSTRACT: The radiation protective, antitumorigenic and radiosensiti-
zing properties of a number of inhibitors were determined. Protection
against radiation shown by 4-methyl-2,6-diteritary butylphenol, as
determined by survival of mice after exposure to 550 r radiation, was
maximum at injections of C = 50 mg/kg. At C = 100 mg/kg = C_{negative},
the mortality rate equaled that of the control; dosages in excess
of C_{negative} were considered radiosensitizing. The behavior of all the
inhibitors studied--polyphenols, substituted hydroxypyridines,

aminophenols and a stabilized free radical--was qualitatively similar. A linear relationship between the antitumorigenic and radiation protective action of the antioxidants was established in a study of the function of leucosis development retardation with respect to the dosage Ctherapeutic/Cnegative. This leads the way to determining conditions for using inhibitors for suppressing tumorigenic processes and in experimental radiation sickness. Orig. art. has: 1 table, 2 figures and 12 formulas.
